                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                             The present sequence encodes a murine parkin2 polypeptide. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene region 6q25.2-27. Parkin2 polypeptides and polymuclectides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease. Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Wilson's disease, Prion disease, and secondary causes inducing pick's disease. Prion disease, and secondary causes inducing parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           THANACCACCTACAACAGCTTTTCATCTACTGCAAAGGCCCCTGCCACAAGGTCCAGC

                                                    The present sequence encodes a murine parkin2 polypeptide. The sequence contains the mutation lysicias. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polymucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease, such as Parkinson's disease, Alzheimer's disease, Huntingson's disease, amyotrophic lateral sclerosis, and secondary causes inducing Parkinson's synchemes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       300

The present sequence encodes a murine parkin2 polypeptide. The present sequence contains mutations, causing Asm54 to be changed to a stop odon, leading to a truncated protein. Wurations or deletions in the parkin2 parkinson of disease in humans. The numan parkin2 good of sease seed to a stop of the parkin2 good of sease. They are useful for analysing the rededeperative diseases. They are also useful for testing the floady of the treatment of a newrodedemerative disease such as parkinson's disease, Alzheimer's disease, Huntington's disease. The parkinson's disease, and sciences, muti-system atrophy, Misor's disease, pick's disease, pick indicates, and is encodeded training parkinson's syndromes like toxins, drugs, briain tumours, head training stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein.
                                                                                                                                                                                                                                                                                                                     Parkin2, Parkinson's disease, 6q25.2-27, neurodegenerative disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral solerosis, Multi-system atrophy, Wilson's disease, Pick's disease: Prion disease, brain tumour, head trauma; stroke, vascular irregularity,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence encodes a murine parking polypeptibe. The polynucleotide sequence contains mutations, causing 31m38 to be changed to a top codon, leading to a truncated protein. Mutations or meletions in the parking gene Parkinson's disease in humans. The human parking gene is located in gene region 6q25.2-27, parking polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for insting the efficacy of the treatment of a neurodegenerative disease such as parkingon's disease, Alzbeiden's disease. Huntington's disease and polynucleotis, Multi-system atrophy, milson's disease, pion disease, Multi-system atrophy, milson's disease, prion disease, Multi-system atrophy, milson's disease, parkingon's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 CTCAGCGAGGGGAAGGGGGGAAGGCCTGGATGACTAAACCTGACAGAAACGCGGTGGG

The present sequence encodes a murine parking polypeptide. The polymcieotide Sequence contains mutations, causing Arg78 to be changed to a stop codon, leading to a truncated protesh. Whitations or deletions in the parking gene cause Parkinson's disease in humans or human parking gene is located in gene region 695.2-27 Parking polymcieotides and protection for analysing considerative disease. The parkinson of 695.2-37 Parking the parkinson of the treatment of a neurodegenerative disease. Price of a neurodegenerative disease such as a protection disease, hithmen's disease, hithmen's disease, hithmen's disease, hithmen's disease, and secondary causes inducing parkingon's syndromes like toxins, dangs, brain tumours, head graums, shock, wascular irregularities or retebolic inrequiarities, associated with a less active or non-active parkin prontin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Farkin2; Parkinson's discase, 6q25.2-27; nourodegenerative discase; Alzheimer's disease; Amutington's disease; amyorophic lateral sclerosis; Multi-system atrophy; Wilson's disease; Prick's disease; Prion disease; brain tumour; head trauma; stroke; vascular irregularity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence encodes a murine parking polypeptide. The projected sequence contains a frameshift mutation, leading to a truncated protein. Mutations or deletions in the parking gene cause Parkinson's disease in Mumans or deletions in the parking gene is coated in gene region 6q25.2-27. Parking polypeptides and polymucleotides are useful, for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease. Alzheimer's disease, Huntington's disease, such a general solerosis, Multi-system atrophy, Misor's disease, parkinson's systems arophy, Misor's disease, parkinson's systems disease, and secondary causes inducing parkinson's systems disease, and trauma, stroke, vascular irregularities or metabolic irregularities, associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ç)

```
The present sequence encodes a murine parking polypeptide. The polypucleotide sequence contains a frameshift mutation, leading to a trundaced protein, mutations or deletions in the parking gene cause Parkinson's disease in humans. The human parking gene is located in gene region 6q25.2-27. Parking polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alizheimer's disease, Huntington's disease, anyotrophic lateral sclerosis, Nulti-system atrophy, Milson's disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, bruin tumours, head traima stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein.
Multi-system atrophy, Milson's disease, Pick's disease, Prion disease, 
brain turour, head trauma, stroke, vascular trregularity:
metabolic irregularity; ss.

The present sequence encodes a murine parking polypoptide. The polymordectide sequence contains a frameshift mutation, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause parkinson's disease in humans. The human parkin2 gene is located in gene ragion 6452.2-27. Parkin2 polypetides and polymordectides takes are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Albrianer's disease, Huntingson's disease, anyotophic lateral sclerosis, Nulli-system arcophy, Mison's disease, prion disease, und secondary causes inducing trainal parkinson's syndromes like toxins, drugs, brain tumours, head trainal, strike, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GGCCCATCTTGCTSGGACGATGTCTAATTCCAAACCSGATGAGTSGTGAGTGCTGCTGTTTTCTTCAAACCGGATGAGTGCTGGTGAGTGTTTTCTGAACCGGATGAGTGGTGAGTGGTGAGTGTTAATTCCAAACGGGATGAGTGGTGGAGTGCGASTGT

The polypucleotide sequence contains a frameshift mutation in, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful. for analysaing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease.

                         Parkin2, Parkinson's disease, 6q25.2-27; neurodegenerative disease; Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis; Multi-system atrophy, Wilson's disease; Pick's disease; Prion disease; Erain tumour; head trauma; stroke; vascular irregularity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence encodes a murine parkin2 polypeptide. The polymurlecoride sequence contains a deletion, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6Q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzhehmer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Wilson's disease, prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           99
                                                                                                                                                                                                      The present sequence encodes a murine parkin2 polypeptide. The present sequence contains a frameshift mutation, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinsch's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing meurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as parkinson's disease, Alzhaimer's disease, Hunington's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Milson's disease, Pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          183
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  557

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 333
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence encodes a murine parkin2 polypeptide. The polymorleotide sequence contains a frameshiff mutation, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause parkinson's disease in humans or the human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polymorleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as parkinson's disease, Alzhehimer's disease, Huntingtor's disease, pick's disease, Prion disease, and secondary causes inducing parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein.

strand cDNA was prepared with the primer adapter of sequence [5] dAGAGAGATTCHOGAGTTAATTAAATTAATTCCCCCCCCCC 1], cDNA was cleaved with BamHI and Xbol. cDNA of size corprised longer than 7 kb was selected before cloning. Vector: a modified pBluescript XS:*! after bulk excision from Lambda FLC I. Cloning sites, 5' end: Sall; 3' end: BamHI. Bost: DALOB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /codon_start=1
